The Gigabyte motherboard, which is listed as compatible, also has the "Sound Enhance" version of the Realtek sound card listed as compatible. Well, after a few hours of searching, I gave up on trying to figure out what I did wrong. The biggest problem is that I don't have any discs around the house. Oh, well. A trip to Best Buy is on the horizon. I'll see if I can salvage this thing. But, does anyone know what this "Sound Enhance" version of the Realtek driver is? The motherboard's manual doesn't say, and I couldn't find any info on the realtek website. The Realtek ALC850 actually has a history of audio issues when paired with some motherboards. The driver itself has issues with some motherboards when it comes to getting the codec to register and providing buffering for the audio. Originally Posted by GeoPi The Gigabyte motherboard, which is listed as compatible, also has the "Sound Enhance" version of the Realtek sound card listed as compatible. The actual chipset should have all the functions necessary to work with any ALC850 codec which is paired with it. The driver is "enhanced" to account for the issue of the codec not registering as often on some motherboards. The install would be the same, only the uninstall would be a little different. The Realtek ALC850 actually has a history of audio issues when paired with some motherboards. Yes, and when dealing with motherboards such as the Intel 775 or 775B, the chipset itself will not work with the Realtek codec. This is a chipset issue. This is one reason why I gave up on getting a Z97 board. I tried a number of motherboards, and all of them have issues with this chipset. In this case the issue is with your motherboard. The audio module itself is an ISA card and has a history of problems when installed on some motherboards. I was able to install the module on my X79 board using the ISA version of the audio module. The 'Sound Enhance' version is the version of the Realtek audio module that was built into the Gigabyte Z97 board. It works the same as the one you have installed. Just to add one point, the motherboard is not incompatible with the Realtek codec, the motherboard is incompatible with the ISA version of the codec 82157476af
